1. Introduction

The CEDS Ontology is the machine-readable expression of the Common Education Data Standards (CEDS). It provides a semantic framework that enables education data to be understood, shared, and exchanged across systems throughout the P20W+ (Early Childhood, K-12, Postsecondary, and Workforce) educational continuum.

The impetus for creating the Ontology resulted from multiple State Education Agency use cases that require the use of CEDS in a machine-readable language, such as JSON, JSON-LD, or XML. A workgroup formed in May 2022 to begin discussions on representing CEDS in JSON or XML. During these discussions, the workgroup decided to create an ontology, which provides the most granular description available, for CEDS. From that ontology, CEDS can then be expressed as JSON, JSON-LD, XML, and several other recognized standards.

1.1 Purpose and Value

The CEDS Ontology serves multiple important purposes:

Education generates enormous amounts of data, yet consistently struggles to answer its most important questions such as:

- How many students who received special education services went on to complete a postsecondary credential?
- Which workforce programs produce durable employment outcomes?
- What does a student's K-12 record actually tell a postsecondary admissions office?

These questions cross system boundaries, and at every boundary, the data changes shape with different names, different structures, and different assumptions about what the same concept means. The data exists. The shared meaning does not.

The CEDS Ontology exists to eliminate that problem at its root.

Rather than harmonizing data after the fact through crosswalks, mapping tables, and manual review, **the Ontology establishes shared meaning before data is ever exchanged**. It does this by formally defining not just what education data elements are called, but what they mean, including how they relate to one another, what values they can hold, and which real-world concepts they represent. An enrollment is not just a field in a database. It is a relationship between a person and an organization, with a defined lifecycle, measurable attributes, and connections to assessments, programs, and outcomes. When that definition is expressed in a machine-readable language that any system can consume, the reconciliation problem largely disappears.

This is what distinguishes an ontology from a data dictionary. A data dictionary names things and describes them. An ontology gives them a persistent, resolvable, relationship-aware identity that survives translation across systems, standards, and time. The CEDS Ontology encodes the collective agreement of the education community about what its data means, in a form that computers can reason over, validate against, and use to drive automated transformations.

The practical implications extend further than interoperability alone. As artificial intelligence (AI) becomes embedded in education systems, surfacing insights, flagging anomalies, and generating reports, the quality of those outputs depends entirely on whether the AI understands the data it is working with. A language model that can query enrollment figures but cannot distinguish an IEP service event from a program participation

record will produce answers that are numerically plausible but semantically incorrect. The CEDS Ontology, expressed as [JSON-LD](#) and compatible with the [Model Context Protocol](#), gives AI systems the semantic context they need to reason about education data correctly rather than just pattern match against it.

None of this value is realized automatically. The Ontology is infrastructure, and infrastructure only matters when it is used. Its purpose is ultimately to make it easier for the people who build, maintain, and depend on education data systems to do their work with greater confidence that the data they produce means what they intend and that the data they receive means what they expect.

1.2 Technical Foundation

The CEDS Ontological Model is built on the [Resource Description Framework](#) (RDF) which is the W3C standard for representing knowledge in a way that machines can read, reason over, and exchange. Choosing RDF was not a purely technical decision. It was **the CEDS Community's commitment to openness and longevity**. RDF is not owned by any vendor, not tied to any platform, and not dependent on any particular implementation. An organization using a SQL Server data warehouse, a state running a cloud-based longitudinal system, and a researcher working in Python can all consume the same ontology without modification.

What makes this practically meaningful is its flexibility of expression. The CEDS Ontology can be serialized, that is, written out in multiple formats depending on what a system needs.

- RDF/XML is the canonical form used for governance and publication.
- JSON-LD makes the ontology consumable by modern web applications and AI systems without requiring specialized RDF tooling.
- Turtle is a compact, human-readable format that makes the ontology easier to review, edit, and version control.
- SHACL constraints travel alongside these serializations to define the rules that valid data must follow. Think of them as the ontology's built-in data quality layer, allowing systems to validate incoming data against the standard before it ever enters a pipeline.

Together, these formats mean that the CEDS Ontology meets implementers where they are, rather than requiring them to adopt a new technology stack to participate.

2. The CEDS Conceptual Model

The CEDS Conceptual Model (CCM) provides a human-readable framework for understanding the Ontological Model. It explains and enables human testing and alignment of the COM and all technical resources that rely on it.

2.1 Core Concepts

CEDS defines eight fundamental concepts that form the foundation of all education data:

Person

Definition: A human being, alive or deceased, as recognized by each jurisdiction's legal definitions. In the ontology, the Person class (C200275) is the root class for all person-related data.

Organization

Definition: An organized group of one or more people with particular purpose. The Organization class (C200239) encompasses all types of educational and related organizations.

Resource

Definition: Any non-person, non-organization entity. It is a broad category encompassing content, tools, and reference definitions.

Membership

Definition: The relationship between a person and an organization, expressed as a role held over a defined period of time. The Membership class (C200257) is the parent class for all other types of Person to Organization classes.

Asset

Definition: The relationship formed when a person or organization has ownership, authorship, stewardship, access, or other rights to a resource.

Event

Definition: A single date/time when a real-world activity occurred, which can relate to any concept or combination of concepts.

Claim

Definition: An assertion made about a subject.

Provenance

Definition: Information about entities, activities, and people involved in producing a piece of data or thing, which can be used to form assessments about its quality, reliability or trustworthiness.

2.2 The Conceptual Model Venn Diagram

The CEDS Conceptual Model is visually represented as a Venn diagram that illustrates how the core concepts relate to one another. This diagram serves as a high-level view of the ontology.

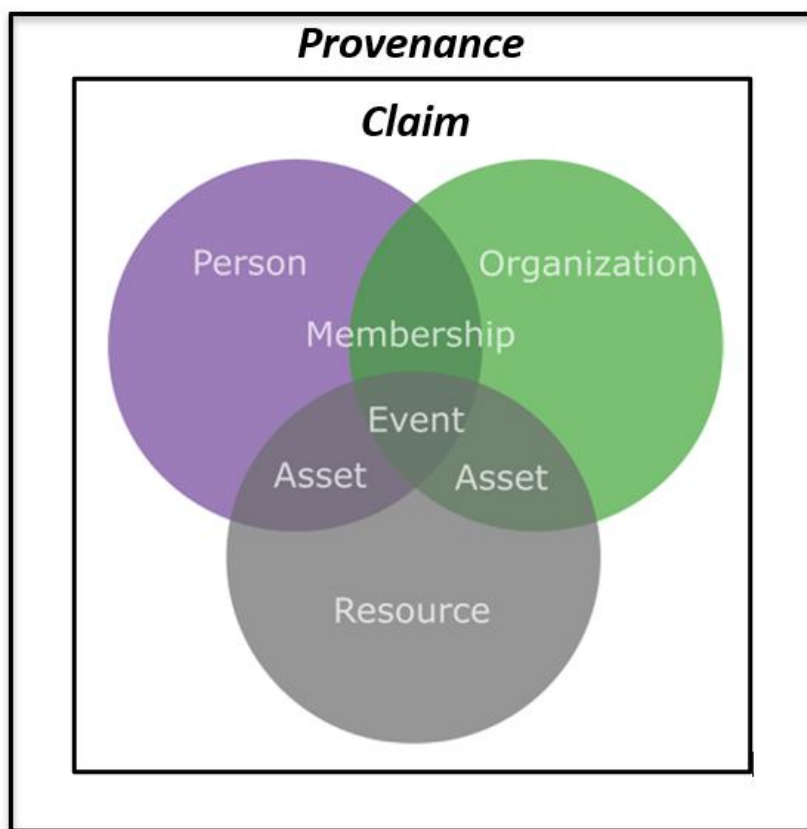

Figure 1: CEDS Conceptual Model Venn Diagram

The CEDS Conceptual Model Venn Diagram provides a visual representation for how each of the eight concepts interact with each other.

- **Person:** may exist on its own or may interact with an Organization or a Resource.
- **Organization:** may exist on its own or may interact with a Person or a Resource.
- **Resource:** may exist on its own or may interact with a Person or an Organization.
- **Membership:** the interaction between a Person and an Organization.
- **Asset:** the interaction between a Person and a Resource or an Organization and a Resource.
- **Event:** may relate to Person, Organization, Resource, Membership, and/or Asset—individually or in any combination.
- **Claim:** any informational assertion made about any one or more concepts. This claim may or may not be verified.
- **Provenance:** metadata stored about all information related to any of the other seven concepts and including its own information.

3. Ontology Components

The CEDS Ontology is comprised of six primary component types: Classes, Subclasses, Object Properties, Data Properties, Concept Schemes (Classes), and Named Individuals.

3.1 Classes

A **Class** represents a category, group, or set of individuals that share common characteristics. Classes are like folders or containers designed to hold certain types of information. The example shown is the Person class. It would hold Object and Data Properties related to a person.

Example - Person Class (C200275):

```
<rdf:Class rdf:about="https://w3id.org/CEDStandards/terms/C200275">
  <dc:creator>Common Education Data Standards</dc:creator>
  <dc:identifier rdf:datatype="http://www.w3.org/2001/XMLSchema#token">C200275</dc:identifier>
  <rdf:label>Person</rdf:label>
  <rdf:subClassOf rdf:resource="https://w3id.org/CEDStandards/terms/C000000" />
  <skos:notation>Person</skos:notation>
  <dc:description>A human being, alive or deceased, as recognized by each jurisdiction's legal definitions.</dc:description>
  <skos:definition>A human being, alive or deceased, as recognized by each jurisdiction's legal definitions.</skos:definition>
  <editHistory rdf:parseType="Collection">
    <editHistoryEntry>
      <changeDescription>Has Person Death property was added to this class.</changeDescription>
      <changeVersion>14.0.0.0</changeVersion>
      <issueLink>https://github.com/CEDStandards/CEDS-Elements/issues/922</issueLink>
      <changeUpdated rdf:datatype="http://www.w3.org/2001/XMLSchema#boolean">true</changeUpdated>
      <changePropertyAddedToClass rdf:datatype="http://www.w3.org/2001/XMLSchema#boolean">true</changePropertyAddedToClass>
    </editHistoryEntry>
  </editHistory>
</rdf:Class>
```

Figure 2: Screenshot of the "Person" Class from the CEDS Ontology

3.2 Subclasses

A **Subclass** is a class that represents a category, group, or set of individuals that share common characteristics. Subclasses are like folders or containers designed to hold certain types of information. Subclasses inherit all of the properties of the parent class and then may add specific properties of their own. A Subclass of Organization is K12 School. Another subclass of Organization is Postsecondary Institution. A Subclass inherits all the properties of its parent Class but can also contain properties specific to just this Subclass. As an example, a Postsecondary Institution and a K12 School both inherit Web Site Address from Organization because both can have a Web Site Address, but only a Postsecondary Institution will offer a Bachelor's Degree.

Example – K12 School (C200199), Subclass of Organization (C200239):

```

<rdfs:Class rdf:about="https://w3id.org/CEDStandards/terms/C200199">
  <dc:creator>Common Education Data Standards</dc:creator>
  <dc:identifier rdf:datatype="http://www.w3.org/2001/XMLSchema#token">C200199</dc:identifier>
  <rdfs:label>K12 School</rdfs:label>
  <rdfs:subClassOf rdf:resource="https://w3id.org/CEDStandards/terms/C200239" />
  <skos:notation>K12School</skos:notation>
  <dc:description>Information specific to K12 Schools. (Organization and related tables have properties that are common.)</dc:description>
  <skos:definition>Information specific to K12 Schools. (Organization and related tables have properties that are common.)</skos:definition>
  <editHistory rdf:parseType="Collection">
    <editHistoryEntry>
      <changeDescription>Has Magnet or Special Program Emphasis Type property was added to this class.</changeDescription>
      <changeVersion>14.0.0.0</changeVersion>
      <issueLink>https://github.com/CEDStandards/CEDS-Elements/issues/1062</issueLink>
      <changeUpdated rdf:datatype="http://www.w3.org/2001/XMLSchema#boolean">true</changeUpdated>
      <changePropertyAddedToClass rdf:datatype="http://www.w3.org/2001/XMLSchema#boolean">true</changePropertyAddedToClass>
    </editHistoryEntry>
  </editHistory>
</rdfs:Class>

```

Figure 3: Screenshot of the Subclass “K12 School” from the CEDS Ontology

3.3 Object Properties (Relationships)

An **Object Property** represents a binary relation between individuals of different classes. They describe connections or links indicating relationships. In the example, C200239 listed in the row schema:domainIncludes represents an Organization class. C200275 listed in the row schema:dataIncludes represents the Person class. The row schema:rangeIncludes with the ID C200079 represents the Credential Award class. The Object Property “has Credential Award” links the Person or Organization Class to the Credential Award Class.

Example - hasCredentialAward (P600360):

```

<rdf:Property rdf:about="https://w3id.org/CEDStandards/terms/P600360">
  <dc:creator>Common Education Data Standards</dc:creator>
  <dc:identifier rdf:datatype="http://www.w3.org/2001/XMLSchema#token">P600360</dc:identifier>
  <rdfs:label>Has Credential Award</rdfs:label>
  <schema:domainIncludes rdf:resource="https://w3id.org/CEDStandards/terms/C200239" />
  <schema:domainIncludes rdf:resource="https://w3id.org/CEDStandards/terms/C200275" />
  <schema:rangeIncludes rdf:resource="https://w3id.org/CEDStandards/terms/C200079" />
  <skos:notation>hasCredentialAward</skos:notation>
  <dc:description>References information about the award of a credential to a person or organization.</dc:description>
  <skos:definition>References information about the award of a credential to a person or organization.</skos:definition>
  <editHistory rdf:parseType="Collection">
    <editHistoryEntry>
      <changeDescription>Created definition to match the class definition it references.</changeDescription>
      <changeVersion>14.0.0.0</changeVersion>
      <issueLink>https://github.com/CEDStandards/CEDS-Ontology/issues/110</issueLink>
      <changeUpdated rdf:datatype="http://www.w3.org/2001/XMLSchema#boolean">true</changeUpdated>
    </editHistoryEntry>
  </editHistory>
</rdf:Property>

```

Figure 4: Screenshot of the Object Property “Has Credential Award” from the CEDS Ontology

3.4 Data Properties (Attributes)

A **Data Property** associates individuals with literal values such as strings, numbers, dates. These are CEDS elements that do NOT have option sets. Unlike Object Properties which link two Classes together, Data Properties capture specific information about a single Class. As an example, the Class Person Birth (C200376) contains Birthdate which is a date.

Example – Birthdate (P000033):

```

<rdf:Property rdf:about="https://w3id.org/CEDStandards/terms/P000033">
  <dc:creator>Common Education Data Standards</dc:creator>
  <dc:identifier rdf:datatype="http://www.w3.org/2001/XMLSchema#token">P000033</dc:identifier>
  <rdfs:label>Birthdate</rdfs:label>
  <schema:domainIncludes rdf:resource="https://w3id.org/CEDStandards/terms/C200376" />
  <schema:rangeIncludes rdf:resource="http://www.w3.org/2001/XMLSchema#date" />
  <skos:notation>Birthdate</skos:notation>
  <dc:description>The year, month and day on which a person was born.</dc:description>
  <textFormat>YYYY-MM-DD</textFormat>
  <skos:definition>The year, month and day on which a person was born.</skos:definition>
  <editHistory rdf:parseType="Collection">
    <editHistoryEntry>
      <changeDescription>Added element to DES contexts to support Adult Education Staff and other person domain needs</changeDescription>
      <changeVersion>10</changeVersion>
    </editHistoryEntry>
  </editHistory>
</rdf:Property>

```

Figure 5: Screenshot of the Data Property “Birthdate” from the CEDS Ontology

3.5 Concept Schemes (Option Sets)

A **Concept Scheme** is a special type of class representing a CEDS element with an Option Set. It contains Named Individuals as valid values. As an example, Race and Ethnicity contains options such as Pacific Islander and Asian.

Example - Race and Ethnicity (C001943):

```

<owl:Class rdf:about="https://w3id.org/CEDStandards/terms/C001943">
  <dc:creator>Common Education Data Standards</dc:creator>
  <dc:description>The origins of a person.</dc:description>
  <dc:identifier rdf:datatype="http://www.w3.org/2001/XMLSchema#token">C001943</dc:identifier>
  <rdf:type rdf:resource="http://www.w3.org/2004/02/skos/core#ConceptScheme" />
  <rdfs:label>Race and Ethnicity</rdfs:label>
  <rdfs:subClassOf rdf:resource="https://w3id.org/CEDStandards/terms/C000000" />
  <skos:definition>The origins of a person.</skos:definition>
  <skos:notation>RaceAndEthnicity</skos:notation>
  <skos:prefLabel>Race and Ethnicity</skos:prefLabel>
</owl:Class>

```

Figure 6: Screenshot of the Concept Scheme “Race and Ethnicity” from the CEDS Ontology

3.6 Named Individuals (Options)

A **Named Individual** is a specific instance belonging to a Concept Scheme. These are the actual option set values in CEDS. In this example, the Named Individual is Native Hawaiian or Pacific Islander.

Example – Native Hawaiian or Pacific Islander (NI001943162281):

```
<owl:NamedIndividual rdf:about="https://w3id.org/CEDStandards/terms/NI001943162281">
  <dc:creator>Common Education Data Standards</dc:creator>
  <dc:description>Individuals with origins in any of the original peoples of Hawaii, Guam, Samoa, or other Pacific Islands,
  | including, for example, Native Hawaiian, Samoan, Chamorro, Tongan, Fijian, and Marshallese.</dc:description>
  <dc:identifier rdf:datatype="http://www.w3.org/2001/XMLSchema#token">NI001943162281</dc:identifier>
  <rdf:type rdf:resource="https://w3id.org/CEDStandards/terms/C001943" />
  <rdf:type rdf:resource="http://www.w3.org/2004/02/skos/core#Concept" />
  <rdfs:label>Native Hawaiian or Pacific Islander</rdfs:label>
  <skos:definition>Individuals with origins in any of the original peoples of Hawaii, Guam, Samoa, or other Pacific Islands,
  | including, for example, Native Hawaiian, Samoan, Chamorro, Tongan, Fijian, and Marshallese.</skos:definition>
  <skos:inScheme rdf:resource="https://w3id.org/CEDStandards/terms/C001943" />
  <skos:notation>NativeHawaiianOrPacificIslander</skos:notation>
  <skos:prefLabel>Native Hawaiian or Pacific Islander</skos:prefLabel>
  <editHistory rdf:parseType="Collection">
    <editHistoryEntry>
      <changeDescription>Updated label (removed "Other") and definition to align with OMB Directive 15</changeDescription>
      <changeVersion>14.0.0.0</changeVersion>
      <issueLink>https://github.com/CEDStandards/CEDS-Elements/issues/1027</issueLink>
      <changeUpdated rdf:datatype="http://www.w3.org/2001/XMLSchema#boolean">true</changeUpdated>
    </editHistoryEntry>
  </editHistory>
</owl:NamedIndividual>
```

Figure 7: Screenshot of the Named Individual “Native Hawaiian or Pacific Islander” from the CEDS Ontology

Below is a diagram of how the components relate to each other.

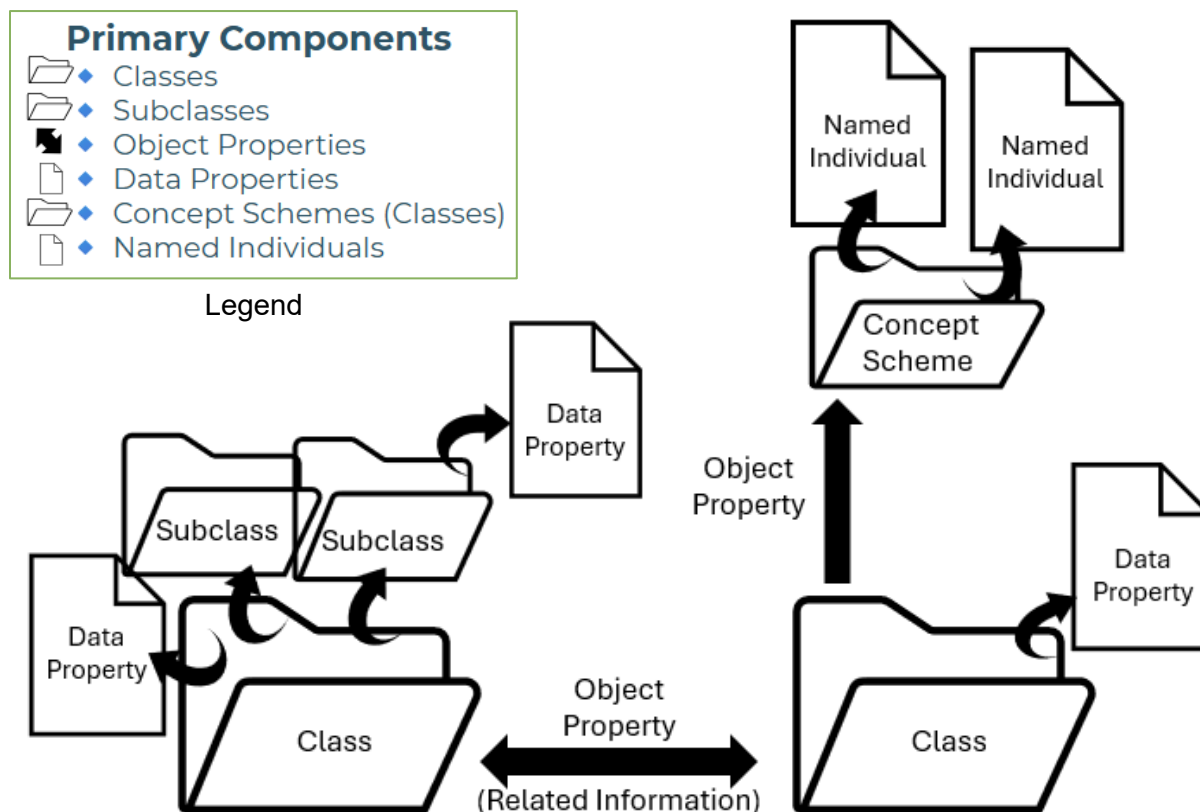

Figure 8: CEDS Ontology Primary Components in a relationship model diagram

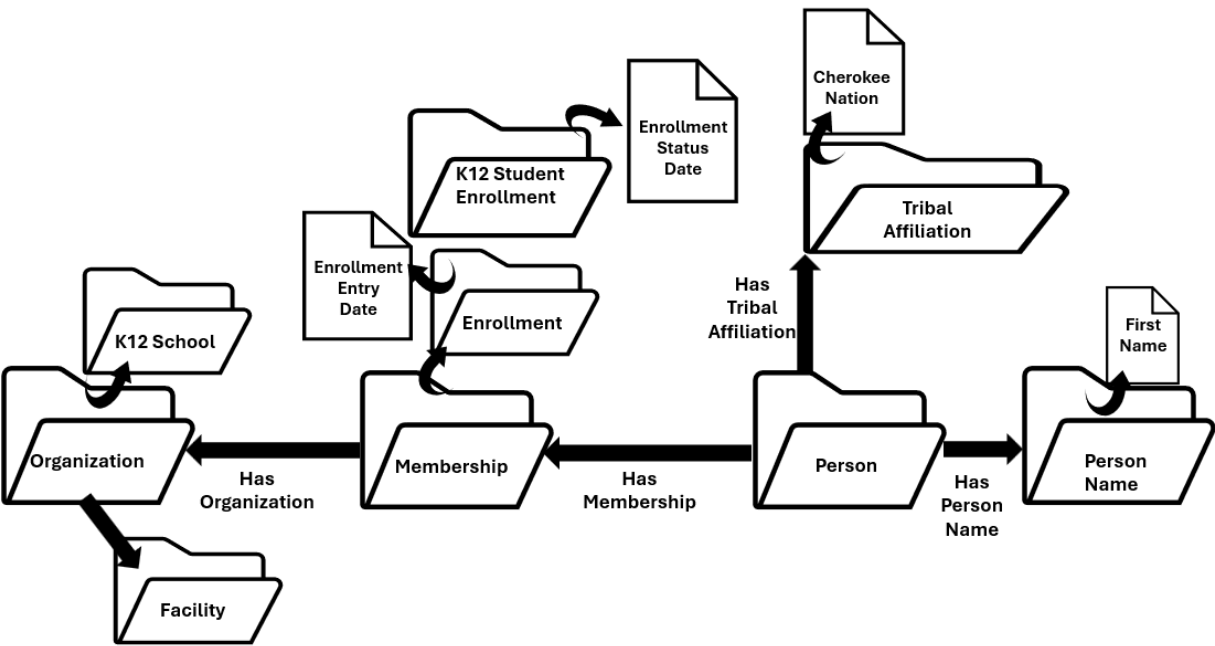

Figure 9: CEDS Ontology Primary Components in a relationship model diagram with examples

3.7 Namespace-Qualified Element Names (QNames)

In the Ontology there are terms used to describe the values known as namespace-qualified element names or QNames for short.

In this snippet of the Ontology, we are looking at the Property “Has Rural Residency Status”. The bolded values such as “P000778” and “Has Rural Residency Status” represent the content or values of the Ontology. Everything else around the content are the QNames that describe the values.

As an example, we will look at `rdfs:label`. It is listed twice – once before the text “Has Rural Residency Status” and once after the same text. It encloses Has Rural Residency Status between it. In doing so, it is describing “Has Rural Residency Status” as an `rdfs:label`.

```
<rdf:Property rdf:about="http://ceds.ed.gov/terms#P000778">
  <dc:creator>Common Education Data Standards</dc:creator>
  <dc:identifier rdf:datatype="http://www.w3.org/2001/XMLSchema#token">P000778</dc:identifier>
  <rdfs:label>Has Rural Residency Status</rdfs:label>
  <schema:domainIncludes rdf:resource="http://ceds.ed.gov/terms#C200309" />
  <schema:rangeIncludes rdf:resource="http://ceds.ed.gov/terms#C000778" />
  <skos:notation>hasRuralResidencyStatus</skos:notation>
  <dc:description>A person who resides in a place with a population of less than 2,500 that is not
near any metropolitan area with a population greater than 50,000, or in a city with adjacent areas
of high density.</dc:description>
  <editHistory rdf:parseType="Collection">
    <editHistoryEntry>
      <changeDescription>Add new DES location</changeDescription>
      <changeVersion>12</changeVersion>
    </editHistoryEntry>
  </editHistory>
  <skos:definition>A person who resides in a place with a population of less than 2,500 that is not
near any metropolitan area with a population greater than 50,000, or in a city with adjacent areas
of high density.</skos:definition>
</rdf:Property>
```

But what is an `rdfs:label`? The value “`rdfs`” refers to Resource Description Framework Schema. It is a standard that is created and maintained by the World Wide Web Consortium (W3C). At the beginning of the CEDS Ontology, various other standards are called out along with their respective websites.

```
<?xml version='1.0' encoding='UTF-8'?>
<rdf:RDF xmlns="https://w3id.org/CEDStandards/terms/"
  xmlns:dc="http://purl.org/dc/elements/1.1/"
  xmlns:owl="http://www.w3.org/2002/07/owl#"
  xmlns:rdf="http://www.w3.org/1999/02/22-rdf-syntax-ns#"
  xmlns:xsd="http://www.w3.org/2001/XMLSchema#"
  xmlns:rdfs="http://www.w3.org/2000/01/rdf-schema#"
  xmlns:skos="http://www.w3.org/2004/02/skos/core#"
  xmlns:schema="https://schema.org/">
  <owl:Ontology rdf:about="https://w3id.org/CEDStandards/terms/">
    <owl:versionInfo>14.0.0.0</owl:versionInfo>
  </owl:Ontology>
```

These standards define their respective QNames. The CEDS Ontology then uses those definitions to describe the CEDS values such as identifiers, definitions, descriptions, names, and option sets of the various CEDS elements.

Returning to our example: `rdfs:label` and “Has Rural Residency Status”, the QName “`label`” can be found by going to <http://www.w3.org/2000/01/rdf-schema#>. The QName “`label`” is defined by w3 as “A human-readable name for the subject.” When CEDS uses `rdfs:label` in the ontology, what is found is the human-readable name for the CEDS class, property, named individual, etc.

All the other QNames have meaning as well and can be found on their respective websites. In this Ontology Guide, we have also provided the list here, but the most up-to-date definitions should be references from the websites where their standards are released.

CEDS Ontology v14 — QName Reference with Official Definitions

This document lists all 37 QNames used in the CEDS Ontology (Version 14), organized by namespace. Definitions are sourced verbatim from the authoritative namespace documents and W3C specifications for each vocabulary. Each namespace section includes a source note explaining where definitions were obtained.

Namespace Declarations

Prefix	Standard	Namespace URI
rdf:	Resource Description Framework (RDF)	http://www.w3.org/1999/02/22-rdf-syntax-ns#
rdfs:	RDF Schema (RDFS)	http://www.w3.org/2000/01/rdf-schema#

-------------	--	---

Complete QName Definitions

rdf: Resource Description Framework (RDF)

<http://www.w3.org/1999/02/22-rdf-syntax-ns#>

Source note: rdfs:comment values from namespace document at <http://www.w3.org/1999/02/22-rdf-syntax-ns#>; serialization attributes (rdf:about, rdf:resource, rdf:datatype, rdf:parseType) are defined in the RDF/XML Syntax Specification and do not appear in the concepts vocabulary.

QName	Namespace / Standard	Source	Official Definition
rdf:RDF	rdf: http://www.w3.org/1999/02/22-rdf-syntax-ns#	Resource Description Framework (RDF)	[RDF/XML Syntax element] The document-level wrapper element for RDF/XML. Defined in the W3C RDF/XML Syntax Specification; not in the RDF concepts vocabulary. Groups RDF triples and declares namespace prefixes.
rdf:Property	rdf: http://www.w3.org/1999/02/22-rdf-syntax-ns#	Resource Description Framework (RDF)	The class of RDF properties.
rdf:type	rdf: http://www.w3.org/1999/02/22-rdf-syntax-ns#	Resource Description Framework (RDF)	The subject is an instance of a class.
rdf:about	rdf: http://www.w3.org/1999/02/22-rdf-syntax-ns#	Resource Description Framework (RDF)	[RDF/XML Syntax attribute] Specifies the URI of the resource being described. Defined in the W3C RDF/XML Syntax Specification; identifies the subject of the RDF statements in an element.
rdf:resource	rdf: http://www.w3.org/1999/02/22-rdf-syntax-ns#	Resource Description Framework (RDF)	[RDF/XML Syntax attribute] Specifies the URI of an object resource in a property element. Defined in the W3C RDF/XML Syntax Specification; used when a property value is a resource rather than a literal.
rdf:datatype	rdf: http://www.w3.org/1999/02/22-rdf-syntax-ns#	Resource Description Framework (RDF)	[RDF/XML Syntax attribute] Specifies the datatype URI of a typed literal. Defined in the W3C RDF/XML Syntax Specification; associates a string value with a datatype to produce a typed RDF literal.
rdf:parseType	rdf: http://www.w3.org/1999/02/22-rdf-syntax-ns#	Resource Description Framework (RDF)	[RDF/XML Syntax attribute] Specifies how the content of a property element should be parsed. Defined in the W3C RDF/XML Syntax Specification. Values: 'Resource', 'Literal', 'Collection'.

rdfs: RDF Schema (RDFS)

<http://www.w3.org/2000/01/rdf-schema#>

Source note: All definitions are verbatim rdfs:comment values from the RDFS namespace document at <http://www.w3.org/2000/01/rdf-schema#>

QName	Namespace / Standard	Source	Official Definition
rdfs:Class	rdfs: http://www.w3.org/2000/01/rdf-schema#	RDF Schema (RDFS)	The class of classes.
rdfs:label	rdfs: http://www.w3.org/2000/01/rdf-schema#	RDF Schema (RDFS)	A human-readable name for the subject.

rdfs:comment	rdfs: http://www.w3.org/2000/01/rdf-schema#	RDF Schema (RDFS)	A description of the subject resource.
rdfs:range	rdfs: http://www.w3.org/2000/01/rdf-schema#	RDF Schema (RDFS)	A range of the subject property.
rdfs:subClassOf	rdfs: http://www.w3.org/2000/01/rdf-schema#	RDF Schema (RDFS)	The subject is a subclass of a class.
rdfs:isDefinedBy	rdfs: http://www.w3.org/2000/01/rdf-schema#	RDF Schema (RDFS)	The definition of the subject resource.

owl: Web Ontology Language (OWL 2)

<http://www.w3.org/2002/07/owl#>

Source note: All definitions are verbatim rdfs:comment values from the OWL 2 namespace document at <http://www.w3.org/2002/07/owl#>.

QName	Namespace / Standard	Source	Official Definition
owl:Ontology	owl: http://www.w3.org/2002/07/owl#	Web Ontology Language (OWL 2)	The class of ontologies.
owl:Class	owl: http://www.w3.org/2002/07/owl#	Web Ontology Language (OWL 2)	The class of OWL classes.
owl:AnnotationProperty	owl: http://www.w3.org/2002/07/owl#	Web Ontology Language (OWL 2)	The class of annotation properties.
owl:NamedIndividual	owl: http://www.w3.org/2002/07/owl#	Web Ontology Language (OWL 2)	The class of named individuals.
owl:Restriction	owl: http://www.w3.org/2002/07/owl#	Web Ontology Language (OWL 2)	The class of property restrictions.
owl:onProperty	owl: http://www.w3.org/2002/07/owl#	Web Ontology Language (OWL 2)	The property that determines the property that a property restriction refers to.
owl:allValuesFrom	owl: http://www.w3.org/2002/07/owl#	Web Ontology Language (OWL 2)	The property that determines the class that a universal property restriction refers to.
owl:equivalentProperty	owl: http://www.w3.org/2002/07/owl#	Web Ontology Language (OWL 2)	The property that determines that two given properties are equivalent.
owl:deprecated	owl: http://www.w3.org/2002/07/owl#	Web Ontology Language (OWL 2)	The annotation property that indicates that a given entity has been deprecated.
owl:versionInfo	owl: http://www.w3.org/2002/07/owl#	Web Ontology Language (OWL 2)	The annotation property that provides version information for an ontology or another OWL construct.

skos: Simple Knowledge Organization System (SKOS)

<http://www.w3.org/2004/02/skos/core#>

Source note: Definitions sourced from the SKOS RDF schema (<https://www.w3.org/2009/08/skos-reference/skos.rdf>) and the W3C SKOS Reference Recommendation (<https://www.w3.org/TR/skos-reference/>). `skos:definition`, `skos:prefLabel`, `skos:inScheme`, and `skos:closeMatch` use `skos:definition` values from the RDF schema. `skos:notation` uses the definition from Section 6 of the SKOS Reference.

QName	Namespace / Standard	Source	Official Definition
skos:definition	skos: http://www.w3.org/2004/02/skos/core#	Simple Knowledge Organization System (SKOS)	A statement or formal explanation of the meaning of a concept.
skos:notation	skos: http://www.w3.org/2004/02/skos/core#	Simple Knowledge Organization System (SKOS)	A notation, also known as classification code, is a string of characters such as "T58.5" or "303.4833" used to uniquely identify a concept within the scope of a given concept scheme.
skos:prefLabel	skos: http://www.w3.org/2004/02/skos/core#	Simple Knowledge Organization System (SKOS)	The preferred lexical label for a resource, in a given language.
skos:inScheme	skos: http://www.w3.org/2004/02/skos/core#	Simple Knowledge Organization System (SKOS)	Relates a resource (for example a concept) to a concept scheme in which it is included. A concept may be a member of more than one concept scheme.
skos:closeMatch	skos: http://www.w3.org/2004/02/skos/core#	Simple Knowledge Organization System (SKOS)	<code>skos:closeMatch</code> is used to link two concepts that are sufficiently similar that they can be used interchangeably in some information retrieval applications. In order to avoid the possibility of "compound errors" when combining mappings across more than two concept schemes, <code>skos:closeMatch</code> is not declared to be a transitive property.

dc: Dublin Core Metadata Element Set, Version 1.1

<http://purl.org/dc/elements/1.1/>

Source note: Definitions from DCMI Metadata Terms (<https://www.dublincore.org/specifications/dublin-core/dcmi-terms/>), Section 3: Properties in the `/elements/1.1/` namespace. `dc:alternative` is defined in the `dcterms:` namespace; definition below is from DCMI Metadata Terms.

QName	Namespace / Standard	Source	Official Definition
dc:description	dc: http://purl.org/dc/elements/1.1/	Dublin Core Metadata Element Set, Version 1.1	An account of the resource.
dc:creator	dc: http://purl.org/dc/elements/1.1/	Dublin Core Metadata Element Set, Version 1.1	An entity primarily responsible for making the resource.

QName	Namespace / Standard	Source	Official Definition
dc:identifier	dc: http://purl.org/dc/elements/1.1/	Dublin Core Metadata Element Set, Version 1.1	An unambiguous reference to the resource within a given context.
dc:alternative	dc: http://purl.org/dc/elements/1.1/	Dublin Core Metadata Element Set, Version 1.1	An alternative name for the resource. The distinction between titles and alternative titles is application-specific.

schema: Schema.org

<https://schema.org/>

Source note: Definitions verbatim from schema.org property pages: <https://schema.org/domainIncludes> and <https://schema.org/rangeIncludes>

QName	Namespace / Standard	Source	Official Definition
schema:domainIncludes	schema: https://schema.org/	Schema.org	Relates a property to a class that is (one of) the type(s) the property is expected to be used on.
schema:rangeIncludes	schema: https://schema.org/	Schema.org	Relates a property to a class that constitutes (one of) the expected type(s) for values of the property.

xsd: XML Schema Definition Language (XSD)

<http://www.w3.org/2001/XMLSchema#>

Source note: XSD datatypes do not have an RDF namespace document with `rdfs:comment` values. Definitions below are from the W3C XML Schema Definition Language (XSD) 1.1 Part 2: Datatypes specification (<https://www.w3.org/TR/xmlschema11-2/>).

QName	Namespace / Standard	Source	Official Definition
xsd:string	xsd: http://www.w3.org/2001/XMLSchema#	XML Schema Definition Language (XSD)	xsd:string represents character strings in XML. The value space of xsd:string is the set of finite-length sequences of zero or more characters.
xsd:nonNegativeInteger	xsd: http://www.w3.org/2001/XMLSchema#	XML Schema Definition Language (XSD)	xsd:nonNegativeInteger is derived from xsd:integer by setting the value of minInclusive to be 0. This results in the standard mathematical concept of the non-negative integers.
xsd:date	xsd: http://www.w3.org/2001/XMLSchema#	XML Schema Definition Language (XSD)	xsd:date represents top-open intervals of exactly one day in duration on the timelines of dateTime, beginning on the beginning moment of each day, up to but not including the beginning moment of the next day.

Notes: (1) RDF/XML serialization attributes (`rdf:about`, `rdf:resource`, `rdf:datatype`, `rdf:parseType`, `rdf:RDF`) are defined in the W3C RDF/XML Syntax Specification, not in the RDF concepts vocabulary namespace document. (2) XSD datatype definitions come from W3C XML Schema Definition Language 1.1 Part 2 prose, as that specification does not publish an RDF namespace document with `rdfs:comment` values. (3) `dc:alternative` is technically defined in the `dcterms: namespace` (<http://purl.org/dc/terms/>) rather than the `dc: namespace` (<http://purl.org/dc/elements/1.1/>), but CEDS uses the `dc:` prefix in the Ontology.

3.8 CEDS Specific QNames

Version 14 includes CEDS-specific QName properties for data validation:

Property	Description
textFormat	Formatting expectations or pattern for a property value
minCount	Minimum number of values required
maxCount	Maximum number of values allowed
maxLength	Maximum string length for a property value
minInclusive	Minimum value (inclusive) for numeric properties
maxInclusive	Maximum value (inclusive) for numeric properties
decimalPlaces	Number of fractional decimal places

3.9 Edit History

Version 14 introduces structured Edit History to track changes. Each entry includes information about the changes made by version. Below are descriptions of all changes tracked in Edit History.

Property	Description
changeDate	The date when a change was made to a class or property.
changeVersion	The version of the ontology in which a change was made to a class or property.
changeDescription	A description of the change made to a class or property.
issueLink	A link (GitHub) to an issue or ticket in a version control system related to the change.
changedBy	The person or system that made the change to a class or property.
changeNew	An indication of whether this represents a new addition to the ontology in the Change version.
changeUpdated	An indication of whether this represents an update to the ontology in the associated Change Version.
changePropertyAddedToClass	An indication of whether this class had a new or previously existing property added in the associated Change Version.

4. Local Usage

Version 14 introduces the concept of Local Usage providing a way to add localized information about standard Classes, Properties, and Named Individuals. When expressing the CEDS Ontology, organizations may choose to add additional information related to local details.

Property	Description
Usage Notes	Usage and/or governance details designated by the organization as essential to understanding and using this element or option correctly. Usage notes should not contradict the CEDS definition but rather enrich it with any specific details needed for successful implementation.
Usage URL	The Uniform Resource Locator (URL) pointing to the local organization's data governance documentation for this element or option.

5. Provenance

The CEDS Ontology includes the concept of record history providing provenance related to information collected. These properties can be applied at the record level to various claims.

Property	Description
Record Reference Identifier	A unique number or alphanumeric code assigned to a record.
Has Record Reference Identification System	A coding scheme that is used for identification and record-keeping purposes to refer to a record.
Record Start Date Time	The start date and, optionally, time that a record is active as used to support version control.
Record End Date Time	The end date and, optionally, time that a record is active as used to support version control.
Has Record Status Type	A process indicator of the level of stability, quality, and/or preparedness of the record.
Record Status Date	The date the record was marked with the Record Status Type.
Committed By Organization	The organization responsible for a specific action or event in the lifecycle of a record. This property links the record to the organization that officially committed an action to the record.
Created By Person	The person responsible for a specific action or event in the lifecycle of a record. This property links the record to the person that officially committed an action to the record.
Has Data Collection Status	A process indicator of the level of stability, quality, and/or preparedness of the collection of data.
Data Collection Academic School Year	The year for a reported school session for which the data is applicable.
Data Collection Close Date	The date the data collection closes or ends.
Data Collection Description	The description of what is included in the data within the context of the data collection based on the source system and collection period as defined by the Data Collection Open Date and Data Collection Close Date.
Data Collection Name	A human readable name used to identify the data within the collection.
Data Collection Open Date	The date the data collection opens or commences.
Data Collection School Year	The year for a reported school session in which the data collection occurs.
Source System Data Collection Identifier	The identifier specified by the source system that uniquely identifies the data collection.
Source System Name	The name of the source system that provided the data within the collection.

6. Domain Model Examples

The following domain models illustrate how the ontology components work together.

6.1 Person Credential Domain

The Person Credential domain illustrates how credentials are awarded to persons, including Credential Awards, Definitions, and Issuers.

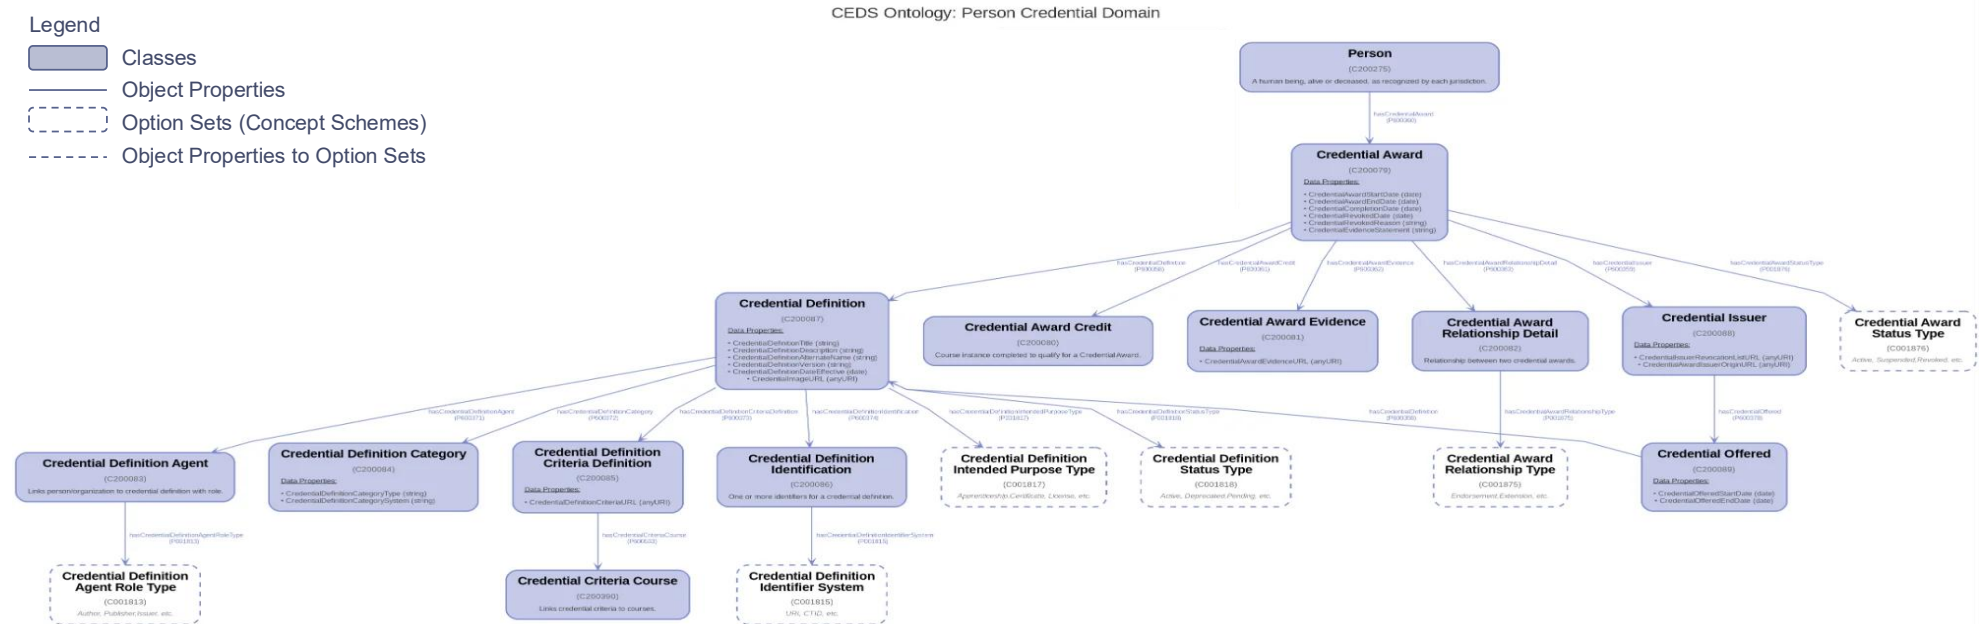

Figure 10: Person Credential Domain Model

Key Classes:

- Person (C200275), Credential Award (C200079), Credential Definition (C200087), Credential Issuer (C200089), Credential Award Status Type

6.2 Person Assessment Domain

The Person Assessment domain shows relationships between persons, assessments, and results.

CEDS Ontology: Person Assessment Domain

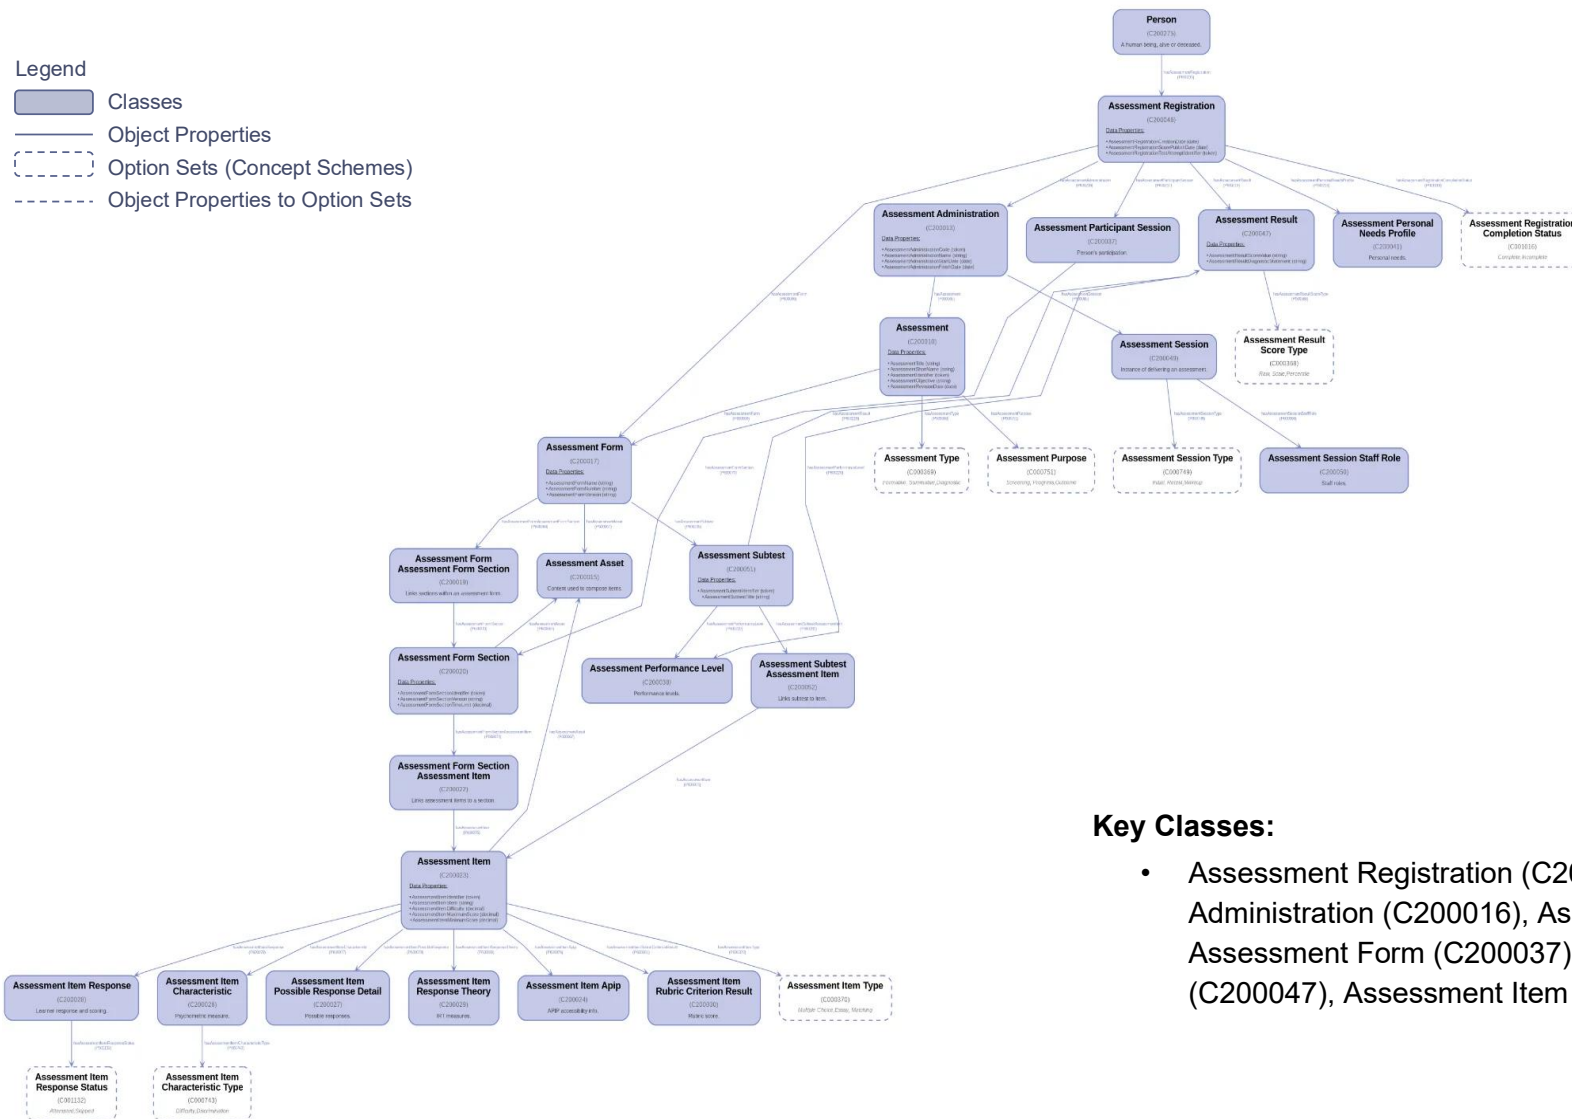

Figure 11: Person Assessment Domain Model

7. Integration of the Conceptual Model and Ontology

The Conceptual model is the overarching high level look at how the Ontology is structured. This section provides a deeper understanding of how the Conceptual Model governs the various classes and properties that exist within the Ontology.

We will begin with an example of a K12 Student enrolled in a K12 School from a local to state reporting claim.

District A provides a record to the state to obtain funding based on a formula called “average daily membership.” The claim is:

1. Jane Doe is the name of the student.
2. Jane Doe is enrolled in School A in District A.
3. Jane Doe is in the 4th grade.
4. Jane Doe’s enrollment began on August 25, 2025, and is currently enrolled.

This information represents a claim being made by District A. Information included with the record or created by the state would include provenance such as:

1. Record Start/End Date Times – indicating when the record is valid
2. Record Reference Identifier – a unique identifier for this specific record allowing it to be tracked back to source and potentially updated in the future.

Modeling this within the Ontology and Conceptual Model, there are numerous properties and classes that link together to form the overall structure but at the base, there are 3 classes and 1 concept scheme where the basic data would be found: Person Name, Enrollment, Organization Title, and Grade Level. From the Conceptual model standpoint:

- Person Name class is information solely about a Person and thus directly relates to the Conceptual Model concept of Person.
- Enrollment class is a subclass of the Membership class within the Ontology. It contains information about the relationship between a Person and an Organization and thus directly relates to the Conceptual Model concept of Membership.
- Because Grade Level (Concept Scheme) is information about the enrollment, it also relates to the Conceptual Model concept of Membership.
- Organization Title class contains information solely about the Organization and thus directly relates to the Conceptual Model concept of Organization.
- The Conceptual Model concept of Event is a single date/time when a real-world activity occurs, which can relate to any concept or combination of concepts. In this instance the Enrollment Entry Date of August 25, 2025, is a single date/time when the student enrolled in School A. This property that rests inside of Membership is therefore an Event that exists directly in the Conceptual Model concept of Membership.

CEDS Ontology		CEDS Conceptual Model	
Class	Person Name	Concept	Person
Property	First Name = Jane		
Property	Last or Surname = Doe		
Class	Enrollment	Concept	Membership
Property	Enrollment Entry Date = August 25, 2025		Event
Concept Scheme	Grade Level	Concept	Membership
Named Individual	4 th Grade		
Class	Organization Title	Concept	Organization
Property	Name of Institution = School A		

Appendix A

Appendix A contains a complete mapping of all Classes to their respective primary and secondary Concepts as well as a listing of all Date Properties that are Events within the Conceptual Model.

Table A-1: All CEDS Classes Mapped to the Conceptual Model

All 400 domain classes from the V14 ontology are included, derived directly from `rdfs:Class` declarations in `CEDS-Ontology.rdf`. Classes that intersect two Conceptual Model concepts are assigned a Primary and Secondary Concept. Classes with a single clear concept leave Secondary as '—'. The eight Conceptual Model concepts are:

- | | |
|-----------------|---------------|
| 1. Person | 5. Asset |
| 2. Organization | 6. Event |
| 3. Resource | 7. Claim |
| 4. Membership | 8. Provenance |

Note: Claim is not used as a direct Primary or Secondary concept for class mapping.

Table A-2: Date Properties That Are Events in the Conceptual Model

Only date/dateTime properties recording a real-world education activity (Events) are included. Concept column reflects the class domain of the property. Multiple concepts indicate the property bridges more than one Conceptual Model concept.

Note: excluded as Provenance:

- changeDate
- Record Start Date Time
- Record End Date Time
- Record Status Date
- Data Collection Open Date
- Data Collection Close Date
- NCES SIDE Date Processed
